Identifying substances with a specific activity in target organisms, useful for drug development, by detecting compounds with related activity in reference organisms

Example 1; Page 28; 76pp; German.

interior unservines a most mechan to use decoration of paramaceutically active in a target organism. The method comprises corganism or tissue and identifying active compounds in the reference organism or tissue and identifying active compounds in the reference corganism or tissue and identifying active compounds in the reference corganism or tissue and identifying active compounds in the reference corganisms or tissue and identifying active compounds in the reference conserved structures, which are used to identify orthologous structures in the target. Optionally the orthologous structures are then conserved structure-based optimisation of the required modified, e.g. by structure-based optimisation of the required as the method is used to identify polypeptides which are then used optionally after optimisation of properties, as pharmaceuticals. Or after validation as a drug target, for development of ligands, also contential pharmaceuticals. Polypeptides and nucleic acids encoding them, con identifying lead structures for pharmaceutical development. The continuity in humans, and should reduce the time between discovery and development of new drugs, since previous understanding of molecular content essary. The identified drugs will usually be very specific, with reduced side effects. Sequencing of a cDNA bank from the mexican bearded lizard effects. Sequencing of a cDNA bank from the mexican bearded content prevention indicated a 136 becquence that, by comparison with sequences in published databases, encoded a 196 amino acid precursor of natriuretic peptide. Analysis of corresponding sequences from other reputies spowed that the N-terminal region of the sequence probably and other encodes peptides that petentiate the effect of bradykinin and inhibit and others. This invention describes a novel method for discovering a substance that angiotensin-converting enzyme.

This invention relates to a novel method for the prevention and intervention into Type 1 diabetes and Latent Autoimmune Diabetes in the Adult (LADA). Specifically, it refers to the administration of a modulator derived from a CD3 and GIP-1 compound. This combined treatment provides a synergistic effect and can attenuate the further destruction of beta-cells, hence improving glycaemic control in diabetic patients. Purthermore, it can be used as a prophylactic for people at high risk for the development of type 1 diabetes and can provide an improved prognosis with respect to microvascular and macrovascular complications. The present invention describes exemin, a GIP-1 compound that is invention describes exemin, and fragments derived thereof that can be used to modulate beta call function. Accordingly, the compositions of this invention exhibit immunosuppressive and antidiabetic activities. This peptide sequence is a GLP-1 compound, the exendin peptide of the invention. New insulin-secreting cell comprising an insulin-secreting cell transfected with a nucleotide sequence encoding a protein selected from glucagons-like peptide-1 (GLP) and its analog, useful for treating diabetes.

Claim 7; SEQ ID NO 4; 45pp; English.

The present invention describes an insulin-secreting cell comprising an insulin-secreting cell transfected with a nucleotide sequence encoding a protein selected from glucagon-like peptide-1 (GLP-1) and its analogue. Also described: (1) constructing an insulin-dependent glucose-secreting cell comprising: (a) providing an insulin-dependent glucose-secreting cell comprising the plasmid minigene construct comprising a plasmid; (b) isolating comprising the plasmid with the minigene construct; and (e) isolating the plasmid in the insulin-secreting cell; (2) determining the ability of a drug to stimulate cells to secreting cell; (2) determining the ability of a drug to stimulate cells in secreting cell; (b) exposing the cell; (c) the drug; and (c) measuring the amount of insulin secreted by the cell; (a) and (3) supplying insulin to a mammal comprising: (a) providing the insulin-secreting cells; (b) exposing the cells; (c) mammal, the body fluid providing an indication of glucose level; and (c) transferring to the mammal insulin secreted from the cells. The insulince secreting cell and methods are useful for treating diabetes. The cells or are also useful for investigating the development and function of the pancreas, the cell that constitutes it, and the secretion it produces. The present sequence represents exemplification of the present invention.

New derivatives of glucagon-like peptide-1 and exendin containing lipophilic substituent, for treating diabetes and obesity.

Claim 82; Page 61; 69pp; English.

The present invention describes derivatives (A1) of GLP-1 (glucagon-like peptide-1) (7-c) (with c = 35 or 36) having just one lipophilic competide-1) (7-c) (with c = 35 or 36) having just one lipophilic competitions (L2) attached to the C-terminal anno acid (aa) and derivatives (A2) of exendin with L3 attached to at least one as of the garent peptide. Al excludes compounds Arg26, Arg34, Lys36-(N-c) epsilon (omega-carboxyX) cLP-1(7-36)-OH, where X = nonadecanoy1, checanoy1 or heptanoy1. Also described are compositions containing A1 and A2 plus a vehicle or carrier. A1 and A2 have containing A1 and A2 plus a vehicle or carrier. A1 and A2 have containing the co

The ivention describes a method for the treatment or prevention of intermittent claudication or skeletal muscle injury caused by ischaemia and/or reperfusion in a human subject, comprising the administration of a glucagon-like peptide-1 (GLP-1) molecule. The method is useful for treating or preventing intermittent claudication or skeletal muscle injury caused by ischaemia and/or reperfusion in a human subject suffering from peripheral vascular disease (PVD). Administration of GLP-1 in a subject improves skeletal muscle performance by promoting glucose oxidation and reducing fatty acid oxidation. This is the amino acid sequence of a mammalian glucost-like peptide-1 peptide GLP-1(1-37) that can be used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     vasotropic; intermittent claudication; skeletal muscle injury; ischaemia; glucagon-like peptide-1; GLP-1; peripheral vascular disease; glucose oxidation; fatty acid oxidation reduction; Glla monster venom;
ovaries, abnormal uterine bleeding and spontaneous abortion, and for restoring regular menses, ovulation and fertility. A GLP-1 molecule reduces insulin resistance or increases insulin sensitivity. The present sequence represents a Gila monster venom peptide, exendin 4, which shows homology to GLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Method for the treatment or prevention of intermittent claudication or skeletal muscle injury caused by ischemia and/or reperfusion in a human subject, comprises administration of a glucagon-like peptide-1 molecule.

The ivention describes a method for the treatment or prevention of intermittent claudication or skeletal muscle injury caused by ischaemia and/or reperfusion in a human subject, comprising the administration of a glucagon-like peptide-1 (GLP-1) molecule. The method is useful for treating or preventing intermittent claudication or skeletal muscle suffering from peripheral vascular disease (PVD). Administration of GLP-1 in a subject improves skeletal muscle performance by promoting glucose oxidation and reducing fatty acid oxidation. This is the amino acid sequence of a mammalian glucagon-like peptide-1 peptide GLP-1(1-37) that can be used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                           vasotropic; intermittent claudication; skeletal muscle injury; ischaemia; glucagon-like peptide-1; GLP-1; peripheral vascular disease; glucose oxidation; fatty acid oxidation reduction; Glla monster venom; exendin 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Method for the treatment or prevention of intermittent claudication or skeletal muscle injury caused by ischemia and/or reperfusion in a human subject, comprises administration of a glucagon-like peptide-1 molecule.

The invention relates to a method for treating polycystic ovary syndrome (PCOS). The method comprises administering a glucagon-like peptide-1 (GLP-1) molecule. The method of the invention has gynecological, depilateric, anorectic, hypotensive, antilipaemic, antilnfertility. A GLP-1 molecule of the invention acts as a plasma glucose regulator, or insulin secretion stimulator. The method is useful for treating polycystic ovary syndrome (PCOS) and its symptoms, particularly insulin resistance, hyperinsulinaemia, type-2 diabetes, obesity, hypertension, hyperlipidaemia, anovulation or irregular ovulation, infertility,
GLP-1, and/or GIP. The treatment may be combined with the administration of dipeptidyl peptidase IV (DPP-IV) inhibitors. ABU91969-ABU91975 represent GLP-1, GLP-1 variant, exendin or GIP peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polycystic ovary syndrome; PCOS; glucagon-like peptide-1; GLP-1; gynaecological; antidiabetic; anorectic; hypotensive; antilipaemic; antiinfertility; depilatory; andocrine-gen.; antiseborrheic; antialedorrheic; antiseborrheic; insulin resistance; hyperinsulinaemia; type-2 diabetes; obesity; hypertension; hyperinsulinaemia; type-2 diabetes; obesity; infertility; hyperandrogenism; anovulation; irregular ovulation; infertility; hyperandrogenism; hiputime; alopecia; acne; enlarged multifollicular ovaries; abnormal uterine bleeding; spontaneous abortion; insulin sensitivity; Gila monster; exendin 3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating polycystic ovary syndrome and associated symptoms e.g. insulin resistance comprises administering glucagon-11ke peptide-1 molecule.
                                                                                                                             Check: 9570

The invention relates to a method for treating polycystic ovary syndrome (PCOS). The method comprises administering a glucagon-like peptide-1 (GLP-1) molecule. The method of the invention has gynecological, antidiabetic, anorectic, hyporensive, antidipaemic, antinfertility, depilatory, andocrine-gen., antiseborrheic, and dermatological activity. A GLP-1 molecule of the invention acts as a plasma glucose regulator, or insulin secretion stimulator. The method is useful for treating polycystic ovary syndrome (PCOS) and its symptoms, particularly insulin resistance, hyperinsulinaemia, type-2 diabetes, obesity, hypertemsion, hyperinsulamenia, type-2 diabetes, obesity, hypertemsion, hyperandrogenism, hirsutism, alopecia, acne, enlarged multifollicular
hyperandrogenism, hirsutism, alopecia, acne, enlarged multifollicular ovaries, abnormal uterine bleeding and sponteneous abortion, and for restoring regular menses, ovulation and fertility. A GLP-1 molecule reduces insulin resistance or increases insulin sensitivity. The present sequence represents a Gila monster venom peptide, exendin 3, which shows homology to GLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polycystic ovary syndrome; PCOS; glucagon-liké peptide-1; GLP-1; gynaecological; antidiabetic; anorectic; hypotensive; antilipaemic; antiinfertility; depilatory; andocrine-gen; antisebornheic; dermatological; plasma docrine-gen; antisebornheic; insulin resistance; hyperinsulinaemia; type-2 diabetes; obesity; hypertension; hyperlipidaemia; anovulation; irregular ovulation; infertility; hyperandrogeniam; alopecia; acne; enfarged multifollicular ovaries; abnormal uterine bleeding; epontaneous abortion; insulin sensitivity; Gila monster; exendin 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating polycystic ovary syndrome and associated symptoms e.g. insulin resistance comprises administering glucagon-like peptide-1 molecule.

protein metabolism. The polypeptides are useful for treating a subject with diabetes (particularly type 2 diabetes) or a neurodegenerative condition (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, stroke, multiple sclerosis, brain injury, spinal chord injury or peripheral neuropathy), as well as for reducing the symptom(s) of neurodegenerative conditions in a subject. The polypoptides are also useful for treating a subject with neurotoxic injury or neurodegenerative condition, or for reducing the symptom(s) of neurotoxic injury or neurodegenerative condition in a subject. The present sequence is a Gila-monster lizard exendin-4 analogue

or a stroke, multiple or their ö New Glucagon-like peptide-1 or exendin-2 polypeptides, analogues, useful for treating a subject with diabetes neurodegenerative condition (e.g. Alzheimer's disease, sclerosis or brain injury).

Example 9; Page 37; 119pp; English.

The invention relates to a purified polypeptide, which comprises the amino acid sequence of Glucagon-like peptide-1 (GLP-1), a GLP-1 analogue, Exendin-4 or an exendin analogue with a spacer between the amino acid residues comparable to residues 7 and 8, or residues 9 of GLP-1. Also include are: (1) reducing neuronal death, promoting neuronal differentiation or proliferation, or promoting growth of neuronal

processes, by contacting one or more neurons with the polypeptide; and (2) reducing formation or accumulation of amyloid protein by contacting one or more neurons with the polypeptide, which affects amyloid precursor protein metabolism. The polypeptides are useful for treating a subject with diabetes (particularly type 2 diabetes) or a neurodegenerative condition (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, stroke, multiple sclerosis, brain injury, spinal chord injury or peripheral neuropathy), as well as for reducing the symptom(s) of neurodegenerative conditions in a subject. The polypeptides are also useful for treating a subject with neurotoxic injury or neurodegenerative condition in a subject. The polypeptides are also useful for treating a subject with neurotoxic injury or neurodegenerative condition in a subject. The present sequence is a Gila-monster lizard exendin-4 analogue Adenoviral vector; glucagon-like peptide 1; GLP-1; GIP; obesity; glucose-dependent insulinotropic peptide; type II diabetes; in vivo expression; dipeptidyl peptidase IV inhibitor; DPP-IV; GLP-1 variant; exendin; antidiabetic; anorectic; gene therapy. WPI; 2003-381685/36. N-PSDB; ACA92262. New viral vectors comprising a sequence encoding glucagons-like peptide 1 or glucose-dependent insulinotropic peptide, a sequence encoding a signal sequence, and a polyadenylation signal, for treating e.g. diabetes or obesity

Disclosure; Page 17; 62pp; English.

The present invention relates to an adenoviral vector comprising a polynucleotide sequence encoding glucagon-like peptide 1 (GLP-1) or glucose-dependent insulinotropic peptide (GIP), a polynucleotide sequence encoding a signal sequence upstream of it, and a polyadanylation signal downstream of it. The viral vector is useful in gene therapy for treating type II diabetes, obesity and related conditions by in vivo expression of

```
The invention relates to a purified polypeptide, which comprises the amino acid sequence of Glucagon-like peptide-1 (GLP-1), a GLP-1 analogue, Escandin-4 or an exendin analogue with a spacer between the amino acid residues comparable to residues 7 and 8, or residues 8 and 9 of GLP-1. Also include are: (1) reducing neuronal death, promoting neuronal differentiation or proliferation, or promoting growth of neuronal processes, by contacting one or more neurons with the polypeptide; and (2) reducing formation or accumulation of amyloid protein by contacting one or more neurons with the polypeptide; and protein metabolism. The polypeptides which affects amyloid precursor protein metabolism. The invention relates to a purified polypeptide, which comprises the amino acid sequence of Glucagon-like peptide-1 (GLP-1), a GLP-1 analogue, Exendin-4 or an exendin analogue with a spacer between the amino acid residues comparable to residues 7 and 8, or residues 8 and 9 of GLP-1. Also include are: (1) reducing neuronal death, promoting neuronal differentiation or proliferation, or promoting growth of neuronal differentiation or accumulation of amyloid protein by contacting one or more neurons with the polypeptide; and (2) reducing formation or accumulation of amyloid protein by contacting one or more neurons with the polypeptide amyloid precursor
disease, amyotrophic lateral sclerosis, stroke, multiple sclerosis, brain injury, spinal chord injury or peripheral neuropathy), as well as for reducing the symptom(s) of neurodegenerative conditions in a subject. The polypeptides are also useful for treating a subject with neurotoxic injury or neurodegenerative condition, or for reducing the symptom(s) of neurotoxic injury or neurodegenerative condition in a subject. The present sequence is a Gila-monster lizard exendin-4 analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Glucagon-like peptide-1; GLP 1; exendin-4; antidiabetic; stroke; nootropic; neuroprotective; antiparkinsonian; anticonvulsant; mutent; cerebroprotective; neuronal death; neuronal differentiation; mutein; neuronal process growth; amyloid protein; diabetes; type 2 diabetes; neurodegenerative condition; brain injury; Allzhaimer's disease; parkinson's disease; huntington's disease; amyloid at selection; amyloic lateral sclerosis; multiple sclerosis; spinal chord injury; peripheral neuropathy; neurotoxic injury; Gla-monster lizard.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New Glucagon-like peptide-1 or exendin-2 polypeptides, or their analogues, useful for treating a subject with diabetes or a neurodegenerative condition (e.g. Alzheimer's disease, stroke, multiple

New Glucagon-like peptide-1 or exendin-2 polypeptides, or their analogues, useful for treating a subject with diabetes or a neurodegenerative condition (e.g. Alzheimer's disease, stroke, multiple sclerosis or brain injury).

Claim 27; Fig 1; 119pp; English.

The invention relates to a purified polypeptide, which comprises the amino acid sequence of Glucagon-like peptide-1 (GLP-1), a GLP-1 analogue, Exendin-1 or an exendin analogue with a spacer between the amino acid residues comparable to residues 7 and 8, or residues 8 and 9 of GLP-1. Also include are: (1) reducing neuronal death, promoting neuronal cafferentiation or proliferation, or promoting growth of neuronal processes, by contacting one or more neurons with the polypeptide, which affects amyloid precursor one or more neurons with the polypeptide, which affects amyloid precursor protein metabolism. The polypeptides are useful for treating a subject with diabetes (particularly type 2 diabetes) or a neurodegenerative condition (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, stroke, multiple sclerosis, brain injury, spinal chord injury or peripheral neuropathy), as well as for caducing the symptom (s) of neurodegenerative conditions in a subject. The polypeptides are also useful for treating a subject with neurotoxic injury or neurodegenerative condition in a subject. The neurotoxic injury or neurodegenerative condition in a subject. The

The invention relates to a purified polypeptide, which comprises the amino acid sequence of Glucagon-like peptide-1 (GLP-1), a GLP-1 analogue, Exendin-4 or an exendin analogue with a spacer between the amino acid residues comparable to residues 7 and 8 or residues 8 and 9 of GLP-1.

Also include are: (1) reducing neuronal death, promoting neuronal differentiation or proliferation, or promoting growth of neuronal differentiation or accumulation of amyloid protein by contacting one or more neurons with the polypeptide, which affects amyloid precursor con or more neurons with the polypeptide, which affects amyloid precursor with diabetes (particularly type 2 diabetes) or a neurodegenerative condition (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, stroke, multiple sclerosis, brain creducing the symptom(s) of neurodegenerative conditions in a subject. The polypeptides are also useful for treating a subject with neurotoxic conjugation or neurodegenerative conditions in a subject. The polypeptides are also useful for treating a subject with neurotoxic conditions in a subject with the symptom of the polypeptides are also useful for treating a subject with neurotoxic the polypeptides are also useful for treating a subject with the polypeptides are also useful for treating a subject with neurotoxic the polypeptides are also useful for treating a subject with neurotoxic the polypeptides are also useful for treating a subject with neurotoxic the polypeptides are also provides and polypeptides and polypeptides are also provides and polypeptides and polypeptides are also provides and polypeptides neurotoxic injury or neurodegenerative condition in a subject. The present sequence is a Gila-monster lizard exendin-4 analogue

Glucagon-like peptide-1; GLP 1; exendin-4; antidiabetic; stroke; nootropic; neuroprotective; antiparkinsonian; anticonvulsant; cerebroprotective; neuronal death; neuronal differentiation; neuronal process growth; amyloid protein; diabetes; type 2 diabetes; neurodegenerative condition; brain injury; Allzhaimer's disease; Parkinson's disease; Huntington's disease; amyorrophic lateral sclerosis; multiple sclerosis; spinal chord injury; peripheral neuropathy; neurotoxic injury; Gila-monster lizard.

20-MAY-2003 (first entry) Gila monster exendin-4.

```
The invention relates to novel analogues of exendin-4 (ABP58572-ABP58576) or their pharmaceutically acceptable salts. The invention also encompasses a procedure for preparing the exendin-4 analogues. Exendin-4 (ABP5878) is a polypeptide obtained from the Mexican beaded lizard (Heloderma horridum) which acts as an agonist of glucagon-like peptide I (Heloderma horridum) which acts as an agonist of glucagon-like peptide I (GLP-1) see ABP58577). Like exendin-4 analogues of the invention have antidiabetic activity, being abbe to promote the secretion of insulin and reduce blood sugar, and are thus applicable in treating type 2 diabetes. Oil micrograms of an exendin-4 analogue was femonstrated to be abbe to reduce blood sugar to approximately 20% of its former value after one hour, and its effects lasted 30 minutes longer than 4 micrograms of insulin. The exendin-4 analogues of the invention permitting large-scale production. The present sequence represents wild-type exendin-4 which is referred to in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polypeptide exendin-4 derivatives, useful for promoting insulin secretion and reducing blood sugar, for treating diabetes type 2.
                                                                                                                                                                 exendin-4 analogue; antidiabetic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABP58578 Length: 39 February 4, 2005 13:32 Type: P Check: 9570 ound using 'seq5' (mohamed337.key)

Heloderma suspectum.

WO2003011892-A2

```
The invention relates to a purified polypeptide, which comprises the amino acid sequence of Glucagon-like peptide-1 (GLP-1), a GLP-1 analogue, Exendin-4 or an exendin analogue with a spacer between the amino acid residues comparable to residues with a spacer between the amino acid residues comparable to residues 7 and 8, or residues 8 and 9 of GLP-1.

Also include are: (1) reducing neuronal death, promoting neuronal differentiation or proliferation, or promoting growth of neuronal processes, by contacting one or more neurons with the polypeptide, and processes, by contacting one or more neurons with the polypeptide, which affects amyloid protein protein metabolism. The polypeptide, which affects amyloid processor protein metabolism. The polypeptides are useful for treating a subject of a neurodegenerative growition (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, erroke, multiple sclerosis, brain disease, amyotrophic lateral sclerosis, erroke, multiple sclerosis, brain injury, spinal chord injury or peripheral neuropathy, as well as for reducing the symptom (s) of neurodegenerative conditions in a subject. The polypeptides are also useful for treating a subject with neurotoxic injury or neurodegenerative condition, are entitly or neurodegenerative conditions in a subject. The polypeptides are also useful for treating a subject with neurotoxic injury or neurodegenerative condition, are an entitly of a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        neurotoxic injury or neurodegenerative condition in a subject. present sequence is wild-type Gila-monster lizard exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2005 13:32 Type: P Check: 9570

digestive hormone disease, atherosclerosis, vascular disease, gestational diabetes. liver disease and cirrhosis, glucocorticoid excess, Cushing's disease, the presence of activated counter regulatory hormones that occur after trauma or a disease, hypertriglyceridemia, chronic pancreatitis, the need for parenteral feeding, and a catabolic state following surgery or injury. Sequences ABB07149-155 represent peptide fragments from gila monster venoms that are homologous to GIP-1 molecules and can be included
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the treatment of hibernating myocardium by administering a GLP-1 (glucagon like peptide-1) molecule. GLP-1 activity may be described as, cardiant, antidiabetic and assotropic. GLP-1 may be used for treating, hibernating myocardium, congestive heart failure, ischaemic cardiomyopathy and diabetic cardiomyopathy. GLP-1 reduces plasma or heart norepinepherine level in a patient. The current sequence represents the glucagon like peptide-1 (GLP-1) known as exendin 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Glucagon like peptide-1; GLP-1; exendin 3; cardiant; antidiabetic; vasotropic; hibernating myocardium; congestive heart failure; ischaemic cardiomyopathy; diabetic cardiomyopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treatment of hibernating myocardium involves administering GLP-1

```
The invention relates to the treatment of hibernating myocardium by administering a GLP-1 (glucagon like peptide-1) molecule. GLP-1 activity may be described as, cardiant, antidiabetic and vasotropic. GLP-1 may be used for treating, hibernating myocardium, congestive heart failure, ischaemic cardiomyopathy and diabetic cardiomyopathy. GLP-1 reduces plasma or heart norepinepherine level in a patient. The current sequence represents the glucagon like peptide-1 (GLP-1) known as exendin 4
                                                                                                                                                                                                                                                                                                                                                     Glucagon like peptide-1; GLP-1; exendin 4; cardiant; antidiabetic; vasotropic; hibernating myocardium; congestive heart failure; ischaemic cardiomyopathy; diabetic cardiomyopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                reatment of hibernating myocardium involves administering GLP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Check: 9570

(IGT) or non-insulin requiring type II diabetes to insulin requiring type II diabetes. The invention also relates to the use of GIP-1, its analogues, derivatives and agonists for increasing the insulin synthesis capability of a subject. The GIP-1 derivative is Arg34, Ivys26 (N-epsilon-(gamma-Glu(N-alpha-hexadecanoyl)))-GIP-1(7-37). The GIP-1 agonist is particularly GIP-1(7-37) and GIP-1(7-37) and the corresponding Thr8, Met8, GIy8 and Val8 analogues. The method is used for delaying progression of impaired glucose tolerance or non-insulin requiring type II diabetes and for increasing
                                                                                                                                                                                                                                                                           insulin synthesis

The invention provides a pharmaceutical composition that comprises a molecule selected from a glucagon-like-peptide-1 (GLP-1) molecule, growth hormone releasing factor (GRF) molecule or a parathyroid hormone (PTH) molecule. The composition further includes a weak acid such as acetic acid. The pH of the composition is 3 - 5. The composition can be used for the treatment of a disease or condition selected from diabetes, excess appetite, obesity, stroke, ischemia, reperfusion injury, disturbed New peptide formulation for treating disease e.g. diabetes, obesity, ischemia comprises peptides, an acid having a specified dissociation constant and an excipient. rapid diuremis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are increosing have a low toxicity, and are easily administered intravenously. Sequences AAX31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Increasing urine flow by administering peptides or peptide agonists.

(renal failure, congestive heart failure, nephrotic syndrome, pulmonary rapid diuresis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing condition/congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAX31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exendin; GLP-1; agoniet; glucagon like peptide-1; insulin synthesis; impaired glucose tolerance; IGT; non-insulin requiring type II diabetes; insulin requiring type II diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of GLP-1, its analogs, derivatives and agonists for increasing insulin synthesis, delaying progression of impaired glucose tolerance or non-insulin requiring type II diabetes to insulin requiring type II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents an exendin peptide, and is a GLP-1 agonist. Th invention relates to the use of a glucagon like peptide-1 (GLP-1), its analogue, derivative, or a GLP-1 agonist for the preparation of a medicament for delaying the progression of impaired glucose tolerance
                                                                                                                                                                                                                                                                         Check: 3183
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                s;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tromholt N,

Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of presponency; cardiac contractility; renal failure; diuretic; concestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing units frow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                            AAY31562 Length: 28 February 4, 2005 13:32 Type: P Check: 237

rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AXX31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Increasing urine flow by administering peptides or peptide agonists;
                                                                                                                                                                                                                                             AAY31563 Length: 33 February 4, 2005 13:32 Type: P Check: 2215 Found using 'seq5' (mohamed337.key)

-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds

Increasing urine flow by administering peptides or peptide agonists.

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renl failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing

The invention relates to new methods of increasing urine flow that

Example 61; Page 62; 94pp; English

```
rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AXX31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility
excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Increasing urine flow by administering peptides or peptide, agonists.

comprises administering an exemdin or exemdin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin agonist, GLP-1 agonist. The new methods using an increasing unine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre
(congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAX31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exendin, agonist, GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Increasing urine flow by administering peptides or peptide agonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to new methods of increasing urine flow that

Increasing urine flow by administering peptides or peptide agonists.

Example 56; Page 59; 94pp; English.

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist. The new methods using an increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemis (renal failure, congestive heart failure, nephrotic syndrome, pulmonary rapid diuresis, preparing an individual for surgical procedure, treating or eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exandin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, treating pre-increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine Increasing urine flow by administering peptides or peptide agonists. Example 57; Page 60; 94pp; English. WPI; 1999-527332/44

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 comprises administering an exendin or exendin agonist, or a GLP-1 agonist. The new methods using an exendin, exendin gonist, GLP-1 or GLP-1 agonist are useful for correasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or sclampsia of pregnancy, and increasing a condition/elsonder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                     28 February 4, 2005 13:32 Type: P Check: 369 (mohamed337.key)

comprises administering an exendin or exendin agonist, or a GLP-1 comprises administering an exendin or exendin agonist, or a GLP-1 comprise comprises administering an exendin or the new methods using an exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, purposedure, capid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating precion recessing renal plasma flow and glomerular filtration rate, treating precion concessing renal plasma flow and glomerular filtration rate, treating precionsing renal plasma flow and glomerular filtration rate, treating precions action can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal (failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Increasing urine flow by administering peptides or peptide agonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to new methods of increasing urine flow
                                                                                                 Type: P Check: 333

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for candin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia or greventing or alleviating a disorder associated with toxic hypervolemia or candidate, preparing an individual for surgical procedure, capid diuresis, preparing an individual for surgical procedure, confersing recamples of pregnancy, and increasing a condition/ disorder that can be alleviated by increasing cardiac contractility classerie heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic,
have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; dirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Increasing urine flow by administering peptides or peptide agonists
                                                                                          Check: 7463
                                                                                        Type: P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Prickett K;

```
The invention relates to new methods of increasing urine flow that

comprises administering an exendin or exendin agonist, or a GLP-1

(glucagon-like peptide) or GLP-1 agonist. The new methods using an

exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for

increasing uthe flow, decreasing potassium concentration in urine,

frenal failure, congestive heart failure, nephrotic syndrome, pulmonary

cdema, dirrhosis, or hypertension). They can also be used for inducing

rapid diuresis, preparing an individual for surgical procedure,

increasing renal plasma flow and glomerular filtration rate, treating pre-

celampsia or eclampsia of pregnancy, and increasing a condition/

celampsia or enlayering an individual for surgical procedure,

increasing renal plasma flow and glomerular filtration rate, treating pre-

celampsia or eclampsia of pregnancy, and increasing a condition/

disorder that can be alleviated by increasing a condition/

(congestive heart failure, pulmonary edema, systemic edema or renal

failure). Unlike prior art duretics, the new methods increase urine

carretion and sodium excretion without increasing pocassium loss, and are

carretion and sodium excretion without increasing pocassium loss, and are

fast acting. They have a prolonged duration of action, are incorropic,

have a low toxicity, and are easily administered intravenously. Sequences

AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of prepagnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "hydroxyproline; C-terminal amide"

comprises administering an exendin or exendin agonist, or a Gib-1.

Comprises administering an exendin or exendin agonist, or a Gib-1.

Comprises administering an exendin or exendin agonist. The new methods using an exendin, exendin agonist, Gib-1 or Gip-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, representing or alleviating a disorder associated with toxic hypervolemia preventing or alleviating a disorder associated with toxic hypervolemia concentration in urine, representing or alleviating a disorder associated with toxic hypervolemia concreasing or alleviating an individual for surgical procedure, rapid diureals, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating precedampsia or eclampsia of pregnancy, and increasing a condition, disorder that can be alleviated by increasing cardiac contractility congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine exerction and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin, agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hyperrolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing increasing renal plasma flow and glomerular filtration rate, treating precedunces increasing or eclampsia of pregnancy, and increasing a condition/ disorder that can be alleviated by increasing acardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine failure) and sodium excretion without increasing potassium loss, and are excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are increosed. AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Prickett K;

```
comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-11ke peptide) or GLP-1 agonist. The new methods using an exendin exendin agonist. The new methods using an exendin exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary cedema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating precalmosia or preparancy, and increasing a condition/ disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure) unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are easily administered intravenously. Sequences have a low toxicity, and are easily administered intravenously. Sequences
                                                                                                                                                                                                            Exendin, agonist, GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contactility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to new methods of increasing urine flow that

```
The invention relates to new methods of increasing urine flow that

Comprises administering an exendin or exendin agonist, or a GLP-1
(glucagon-like peptide) or GLP-1 agonist. The new methods using an
exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for
increasing urine flow, decreasing potassium concentration in urine,
preventing or allevitating a disorder associated with toxic hypervolemia
(renal failure, congestive heart failure, nephrotic syndrome, pulmonary
edema, cirrhosis, preparing an individual for surgical procedure,
increasing renal plasma flow and glomerular filtration rate, treating pre-
colampsia or eclampsia of pregnancy, and increasing a condition/
disorder that can be alleviated by increasing cardiac contractility
(congestive heart failure, pulmonary edema, systemic edema or renal
failure). Unlike prior art diurelies, the new methods increase urine
excretion and sodium excretion without increasing potassium loss, and are
east acting. They have a prolonged duration of action, are increpto,
have a low toxicity, and are eastly administered intravenously. Sequences
AXY11505-560 represent examples of exendin agonists compounds
                                                               Exendin, agonist, GLP-1; glucagon-like peptide, toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                'note= "thioproline, C-terminal amide"

                                                                                                                                                                                                                                                                                                                                                                                                                 Young AA,
 The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filltration rate, treating pre-eclampsia or eclampsia of pregrancy, and increasing a condition/disorder that can be alleviated by increasing contractility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (congestive heart failure, pulmonary edema, gystemic edema or renai
failure). Unlike prior art diuretics, the new methods increase urine
excretion and sodium excretion without increasing potassium loss, and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences

The invention relates to new methods of increasing urine flow that comprises administering an exendin agonist, or a Gib-1 (glucagon-like peptide) or GiP-1 agonist. The new methods using an exendin, exendin agonist, Gib-1 agonist. The new methods using an exendin, exendin agonist, Gib-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hyperolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of preparancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are
                                                                                                                                                                                                                                                                                                                                                                              pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     intravenously. Exendin agonist peptide.
08-NOV-1999
The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-11ke peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for candin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolenia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing increasing renal plasma flow and glomerular filtration rate, treating preclampsia or eclampsia of pregnancy, and increasing a condition/ increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine failure) and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                  Exendin, agonist, GLP-1, glucagon-like peptide, toxic hypervolemia, diuresis, renal plasma flow; glomerular filtration rate, pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                        Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY31543 Length: 31 February 4, 2005 13:32 Type: P Check: 6930 Found using 'seq5' (mohamed337.key)

comprises administering an exemblion or examination of the comprises administering an exemblion or exemblion agonist, GLP-1 agonist. The new methods using an exemblion exemblin agonist, GLP-1 agonist. The new methods using an increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (frenal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating preclampais or eclampsia of pregnancy, and increasing a condition/
cincreasing renal plasma flow and glomerular filtration rate, treating preclampsia or eclampsia of pregnancy, and increasing a condition/
clisorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal callure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences
Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; dutuesis; renal plasma filow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Increasing urine flow by administering peptides or peptide agonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to new methods of increasing urine flow that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAY31544 Length: 30 February 4, 2005 13:32 Type: P Check: 4450 Found using 'seq5' (mohamed337.key)

08-NOV-1999 (first entry)

Exendin agonist peptide.

```
comprises administering an examedian or exendin agonist, or a GLD-In comprises administering an examedian or exendin agonist, or a GLD-In agonist. The new methods using an exendin, exendin agonist, GLD-In agonist. The new methods using an increasing united flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal fallure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or celampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diluresis, preparing an individual for surgical procedure, treating nincreasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/eclampsia or an be alleviated by increasing earlier contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are induropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds AAY31542 Length: 31 February 4, 2005 13:32 Type: P Check: 7369 Found using 'seq5' (mohamed337.key) to: 31 1 match found in sequence:

                                                                                                                                                                                                                                                                                        19-AUG-1999,
                                                                                                                                                                                                                                                                                                                                                                                                              Young AA,
                                                                                                                                                    Synthetic.
The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist. The new methods using an concreasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular fillration rate, treating pre-eclampsia or eclampsia of prepancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and godium excretion without increasing potassium loss, and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                     Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregenancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAY31539 Length: 33 February 4, 2005 13:32 Type: P Check: 2325 Found using 'seq5' (mchamed337.key)

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuncasis, preparing an individual for surgical procedure, treating nincreasing an individual failure and increasing a condition rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY31540 Length: 32 February 4, 2005 13:32 Type: P Check: 25 Found using 'seq5' (mohamed337.key)

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist. The new methods using an increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition eclampsia or pregnancy, and increasing a condition disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for exendin, exending or GLP-1 agonist. The new methods using an exendin, exending a clarifing a disorder associated with toxic hyperrolemia (congestive heart failure, respitation in urine, congestive heart failure, capid diuresis, or hypertension). They can also be used for inducing capid duresis, preparing an individual for surgical procedure, capid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating precentagoner that can be alleviated by increasing a condition/ clasorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are excreting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists componeds

OB-NOV-1999 (first entry)

```
The invention relates to new methods of increasing urine flow that

comprises administering an exendin or exendin agonist, or a GLP-1

comprises administering an exendin or exendin agonist, or a GLP-1

(glucagon-like peptide) or GLP-1 agonist. The new methods using an

exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for

increasing urine flow, decreasing potassium concentration in urine,

cran alleviating a disorder associated with toxic hypervolenia

(renal failure, congestive heart failure, nephrotic syndrome, pulmonary

cdema, cirrhosis, or hypertension). They can also be used for inducing

rapid diuresis, preparing an individual for surgical procedure,

increasing renal plasma flow and glomerular filtration rate, treating pre-

calampsia or eclampsia of pregnancy, and increasing a condition/

clasorder that can be alleviated by increasing a condition/

clasorder that can be alleviated by increasing oardiac contractility

(congestive heart failure, pulmonary edema, systemic edema or renal

failure). Unlike prior art diuretics, the new methods increase urine

catching. They have a prolonged duration of action, are increopic,

fast acting. They have a prolonged duration of action, are increopic,

have a low toxicity, and are easily administered intravenously. Sequences

AAY31505-560 represent examples of exendin agonists compounds
                                                                     Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Increasing urine flow by administering peptides or peptide agonists.

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 comprises administering an exendin or exendin agonist, or a GLP-1 cglucagon-like peptide) or GLP-1 agonist. The new methods using an exendin agonist, GLP-1 agonist are useful for comparing urine flow, decreasing potessium concentration in urine, increasing urine flow, decreasing potessium concentration in urine, crownerting or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edemm, cirrhosis, or hypertension). They can also be used for inducing crapid duriesis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating precelaments in the condition of a condition, congestive heart failure, pulmonary edemma, systemic edema or renal congestive heart failure, pulmonary edemma, systemic edema or renal callure procession without increasing potessium loss, and excretion and sodium excretion without increasing potessium loss, and are contracting. They have a prolonged duration of action, are increopic, and have a low toxicity, and are excretion, are increopic, and have a low toxicity, and are easily administered intravenously. Sequences
                                                                         Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY31536 Length: 34 February 4, 2005 13:32 Type: P Check: 5178 ound using 'seq5' (mohamed337.key)

The invention relates to new methods of increasing uine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or allevidating a disorder associated with toxic hypervolemia (renal failure, congestive heart saliure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing crapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diurecies, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are
                                                                                 Exendin; agonist; GLP-1; glucagon-11ke peptide; toxic hypervolemia; dluresls; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY31533 Length: 36 February 4, 2005 13:32 Type: P Check: 9894 Found using '8eq5' (mohamed337.key)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY31505-560 represent examples of exendin agonists compounds

toxic hypervolemia;

```
The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 agonist. The new methods using an exendin exendin agonist. GLP-1 agonist. The new methods using an candin, exendin agonist, GLP-1 agonist. The new methods using an candin, exendin agonist, GLP-1 agonist. The new methods using an increasing urine flow, decreasing potassium concentration in urine, preventing or allevitating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, preparing an individual for surgical procedure, rapid diureals, preparing an individual for surgical procedure, colampsia or calampsia of pregnancy, and increasing a condition/diocoder that can be allevitated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are easily administered intravenously. Sequences have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                              Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; dutresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Increasing urine flow by administering peptides or peptide agonists.

```
The invention relates to new methods of increasing urine flow that

comprises administering an exendin or exendin agonist, or a GLP-1

comprises administering an exendin or exendin agonist, or a GLP-1

comprises administering and GLP-1 agonist. The new methods using an

exendin exendin agonist, GLP-1 or GLP-1 agonist are useful for

exendin exendin for GLP-1 agonist. The nurine,

increasing urine flow, decreasing potassium concentration in urine,

creal failure, congestive heart failure, nephrotic syndrome, pulmonary

creal failure, preparing an individual for surgical procedure,

increasing renal plasma flow and glomerular filtration rate, treating pre-

clampsia or eclampsia of pregnancy, and increasing a condition/

clasorder that can be alleviated by increasing acidiac contractility

clasorder that can be alleviated by increasing acidiac contractility

(congestive heart failure, pulmonary edema, systemic edema or renal

failure). Unlike prior art diuretics, the new methods increase urine

excretion and sodium excretion without increasing possessum loss, and are

cast acting. They have a prolonged duration of action, are inotropic,

have a low toxicity, and are easily administered intravenously. Sequences

ANY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1532 Length: 36 February 4, 2005 13:32 Type: P. comperies administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist. The new methods using an exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia creasing urine flow, decreasing of the concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia creasing canal failure, congestive heart failure, nephrotic syndroms, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerluar filtration rate, treating precedampsia or eclampsia of pregnancy, and increasing contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure) unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are increopic, have a low toxicity, and are easily administered intravenously. Sequences AAY1505-560 represent examples of exendin agonists compounds

```
The invention relates to new methods of increasing urine flow that comparises administering an exendin or examdin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist. The new methods using an exendin, exendin agonist. GLP-1 agonist. The new methods using an comparison-like peptide) or GLP-1 agonist. The new methods untine, increasing urine flow, decreasing poctassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia or increasing urine, plantonic syndrome, pulmonary edema, dirrhosis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating precelampsia or eclampsia of pregnancy, and increasing acondition/ congestive heart failure, pulmonary edema, systemic edema or renal congestive heart failure, pulmonary edema, systemic edema or renal congestive heart failure, pulmonary edema, systemic edema or renal congestive heart failure, pulmonary edema, systemic edema or renal congestive heart failure, pulmonary edema, systemic edema or renal congestive heart failure, pulmonary edema, systemic edema or renal congestive heart failure, pulmonary edema, systemic edema or renal congestive heart failure, pulmonary edema, systemic edema or renal congestive heart failure, pulmonary edema, systemic edema or renal congestive heart failure, pulmonary edema, systemic edema or renal congestive heart failure, pulmonary edema, systemic edema or renal congestive heart failure, pulmonary and are easily administered intravenously. Sequence 37 AA;

AAY31505-E60 represent examples of exendin agonists compounds systemic edems or renal edem or systemic edems or renal examples of exendin agonist peptide.

```
The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic bypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma.flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAV31505-560 represent examples of exendin agonists compounds

```
The invention relates to new methods of increasing urine flow that

comprises administering an exendin or exendin agonist, or a GLP-1

comprises administering an exendin or exendin agonist, or a GLP-1

comprises administering an GLP-1 agonist. The new methods using an

exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for

exendin, exending a disorder associated with toxic hypervolemia

creasing urine flow, decreasing potassium concentration in urine,

creading an alleviating a disorder associated with toxic hypervolemia

creading cirrhosis, or hypertension). They can also be used for inducing

capid diuresis, preparing an individual for surgical procedure,

increasing renal plasma flow and glomerular filtration rate, treating pre-

clampsia or eclampsia of pregnancy, and increasing a condition/

disorder that can be alleviated by increasing actdiac contractility

(congestive heart failure, pulmonary edema, systemic edema or renal

failure). Unlike prior art diuretics, the new methods increase urine

excretion and sodium excretion without increasing pocassium loss, and are

fast acting. They have a prolonged duration of action, are indured;

have a low toxicity, and are easily administered intravenously. Sequences

AAY31505-560 represent examples of exendin agonists compounds

```
The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diurefics, the new methods increase urine excretion and godium excretion without increasing potassium loss, and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for exendin, examine flow, decreasing potassium concentration in urine, increasing urine flow, decreasing potassium concentration in urine, corpositive heart failure, nephrotic syndrome, pulmonary cemal failure, congestive heart failure, They can also be used for inducing confirmation rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating precedure that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are easily administered intravenously. Sequences AAY11505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY31526 Length: 28 February 4, 2005 13:32 Type: P Check: 9991

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia preventing or alleviating a disorder associated with toxic hypervolemia preventing or alleviating a disorder is especially properties, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, clampsia or calampsia of pregnancy, and increasing a condition/clampsia or eclampsia of pregnancy, and increasing a condition/clampsia or elampsia of pregnancy, and increasing candia contractility disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine failure, have a methods increasing prediction and sodium excretion without increasing prediction and sodium excretion without increasing prediction increasing cardiac and are increased or entally the state of the prior art diuretics, the new methods increase urine failure).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAV31505-560 represent examples of exendin agonists compounds
                                                               Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ncreasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Prickett K;

Increasing urine flow by administering peptides or peptide agonists.

Example 23; Page 42; 94pp; English

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 comprises administering an exendin or exendin agonist. The new methods using an exendin agonist. The new methods using an exendin agonist, GLP-1 agonist. The new methods using an exendin agonist, GLP-1 agonist. The new methods using an urine, increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia ("renal failure, congestive heart failure, nephrotic syndrome, pulmonary came, dirrhosis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating preceduance that can be alleviated by increasing a condition/ elasorder that can be alleviated by increasing acidiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal caloure, unlike prior art diuretics, the new methods increase urine failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing or excretion and sodium excretion without increasing or elancing. They have a prolonged duration of action, are increopic, have a low toxicity, and are easily administered intravenously. Sequences and alleviate art examples of exendin agonists compounds

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist. The new methods using an exendin agonist, GLP-1 agonist. The new methods using an exendin acreasing proteasing more are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolenia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating preclampsia or calampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diurencies, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are eaching. They have a prolonged duration of action, are inotropic, have a low toxicity, and are eachly administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                           Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; dutuesis; renal plasma flow; glomentlar filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin agonist, GLP-1 or GLP-1 agonist are useful for exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, concentration or alleviating a disorder associated with toxic hyperrolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing concreasing renal plasma flow and glomerular filtration rate, treating precelampsia or eclampsia of pregnancy, and increasing a condition/ disorder that can be alleviated by increasing acaddiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are incircopic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists componeds
                                                                           Exendin, agonist, GLP-1, glucagon-like peptide, toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregenancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Increasing urine flow by administering peptides or peptide agonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAY31522 Length: 28 February 4, 2005 13:32 Type: P Check: 30 Found using '8eq5' (mohamed337.key)

```
The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for candin, exendin agonist, GLP-1 agonist. The new methods using an exendin agonist, GLP-1 agonist. The new methods using an exendin agonist, or Large and alsorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, preparing an individual for surgical procedure, increasing renal plaama flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diurecies, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are eaching they have a prolonged duration of action, are increosed chave a low toxicity, and are eachly administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                          diuresis, renal plasma flow, glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Increasing urine flow by administering peptides or peptide agonists.
                                                                             agonist; GLP-1; glucagon-like peptide; toxic hypervolemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAY31519 Length: 28 February 4, 2005 13:32 Type: P Check: 193

comprises administrating an exendin or exendin agonist, or a Gib-1 central form.

(glucagon-like peptide) or Gib-1 agonist. The new methods using an exendin, exendin gonist, Gib-1 or Gib-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to new methods of increasing urine flow that

comprises administering an examin or examin agonist, or a GLD-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist. The new methods using an increasing untreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing acrdiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase utine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inctropic, have a low toxicity, and are easily administered intravenously. Sequences AAV31505-560 represent examples of exendin agonists compounds

Exendin agonist peptide.

```
The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin, exendin agonist. GLP-1 agonist are useful for careasing urine flow, decreasing potassium concentration in urine, increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia or capid diuresis, preparing an individual for surgical procedure, rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating precedangesis or eclampsia of pregnancy, and increasing a condition/ disorder that can be alleviated by increasing cardiac contractility congestive heart failure, pulmonary edema, systemic edema or renal failure, pulmonary edema, systemic edema or renal callure prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences

```
The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist. The new methods using an increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing capid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating precelampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diureties, the new methods increase urine excretion and sodium excretion without increasing potassium and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY11505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Check: 107

comprises administering an examin or exemin agonist. or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin agonist, GLP-1 agonist. The new methods using an increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fast acting. They have a prolonged duration of action, are inctropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              excretion and sodium excretion without increasing potassium loss, and are

comprises administering an extendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin agonist, GLP-1 agonist. The new methods using an exendin agonist, GLP-1 agonist. The new methods using an increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia frenal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirthosis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Exendin agonist peptide.

```
The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist. The new methods using an increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal callure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are increasing.

```
comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist. The new methods using an exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potessium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, dirkhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-clampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAV31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to new methods of increasing urine flow that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAY31512 Length: 28 February 4, 2005 13:32 Type: P Check: 151 Found using 'seq5' (mohamed337.key)

```
The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filltration rate, treating pre-eclampsia or eclampsia of pregrancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      fast acting. They have a prolonged duration of action, are inotropic, nave a low toxicity, and are easily administered intravenously. Sequences

Increasing urine flow by administering peptides or peptide agonists

Prickett K;

Young AA, Vine W, Beeley NRA,

WPI; 1999-527332/44.

(AMYL-) AMYLIN PHARM INC.

99WO-US002554. 98US-0075122P.

05-FEB-1999; 13-FEB-1998; The invention relates to new methods of increasing urine flow that

Example 9; Page 35; 94pp; English.

```
comprises administering on exempting straing straing straing or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist. The new methods using an increasing urner flow, decreasing poteasium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal fallure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing increasing renal plasma flow and glomerular fillration rate, treating pre-eclampsia or celampsia of pregrancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potessium loss, and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 fast acting. They have a prolonged duration of action, are inctropic, have a low toxicity, and are easily administered intravenously. Sequences AAV31505-560 represent examples of exendin agonists compounds

comprises administering an examination of the comprises administering an examination of the comprises administering an examination of glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing unter flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal fallure, congestive heart fallure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or colampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diureties, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are

Increasing urine flow by administering peptides or peptide agonists

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diluresis, preparing an individual for surgical procedure, treating increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/eclampsia or en be alleviated by increasing eardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds Example 7; Page 34; 94pp; English.

```
The invention relates to new methods of increasing urine flow that

comprises administering an exendin or exendin agonist, or a GLP-1

(glucagon-like peptide) or GLP-1 agonist. The new methods using an

exendin, exendin agonist, GLP-1 agonist. The new methods using an

exendin, exendin agonist, GLP-1 agonist. The new methods using an

exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for

increasing urine flow, decreasing potassium concentration in urine,

preventing or alleviating a disorder associated with toxic hypervolemia

(renal failure, congestive heart failure, nephrotic syndrome, pulmonary

edema, cirrhosis, or hypertension). They can also be used for inducing

capid diuresis, preparing an individual for surgical procedure,

increasing renal plasma flow and glomerular filtration rate, treating pre-

eclampsia or eclampsia of pregnancy, and increasing a condition/

disorder that can be alleviated by increasing cardiac contractility

(congestive heart failure, pulmonary edema, systemic edema or renal

failure). Unlike prior art diuretics, the new methods increase urine

excretion and sodium excretion without increasing potassium loss, and are

fast acting. They have a prolonged duration of action, are inotropic,

have a low toxicity, and are easily administered incravenously. Sequences

AXY31505-560 represent examples of exendin agonists compounds

comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist. GLP-1 agonist. The new methods using an exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary cedema, oirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating precedema, or eclampsia of pregnancy, and increasing a condition/ disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are alow toxicity, and are easily administered intravenously. The present sequence represents an exendin-3 peptide which can be used in the methods of the invention

```

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin agonist, GLP-1 or GLP-1 agonist are useful for careasing usine flow, decreasing potassium concentration in urine, increasing usine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia concentration in urine, congestive heart failure, nephrotic syndrome, pulmonary cema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, concentration rate, treating precedure, and plasma flow and glomenlar filtration rate, treating precedure that can be alleviated by increasing cardiac contractility disorder that can be alleviated by increasing cardiac contractility congestive heart failure, pulmonary edema, spatemic edema or renal cancer acting They have a prolonged duration of action, are increasing corting. They have a prolonged duration of action, are increasing presents and are easily administered increasing in the present sequence represents an exendin-4 peptide which can be used in the present sequence represents an exendin-4 peptide which can be used in the

plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   regulate gastric motility and slow gastric emptying. The peptides can lused for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes hyperglycaemic or hypoglycaemic conditions. They can also be used for treatment of disorders which would be benefited by agents which lower

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 regulate gastric motility and slow gastric emptying. The peptides can used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes thyperglycaemic or hypoglycaemic conditions. They can also be used for treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptyin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exemin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and typerglycaemic or hypoglycaemic conditions. They can also be used for the treatment of agents which lower treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                             New exendin agonist peptides – can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                        AAY24809 to AAY24877 represent exendin agonist peptides which can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes thyperglycaemic or hypoglycaemic conditions. They can also be used for treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptyii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. dlabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which hower
                                   AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exendin agonist peptides - can regulate gastric motility and slow rric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAY24809 to AAY24877 represent exendin agonist peptides which can

benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can lused for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes hyperglycaemic or hypoglycaemic conditions. They can also be used for treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptyir
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ablility to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in reatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, 'e.g. diabetes.
                                                                                                                                                                                                      New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as agents to regulate gastric motility and to slow gastric emptying, as mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

aay24856 ; Exendin agonist peptide #48
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

Prickett KS;

Beeley NRA,

WPI; 1999-394773/33.

(AMYL-) AMYLIN PHARM INC.

Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

Heloderma sp. WO9925727-A2

Synthetic

Exendin agonist peptide #48.

(first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AMY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can bused for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes hyperglycaemic or hypoglycaemic conditions. They can also be used for treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptyir
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY24856 Length: 36 February 4, 2005 13:32 Type: P Check: 869 Found using 'seq5' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as agents to regulate gastric motility and to slow gastric emptying, as mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in reatment of disorders which lower benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                               regulate gastric motility and slow 3, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New exendin agonist peptides – can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

                            regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and typerglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disporders which would be benefited by agents which lower plasma glucose levels and in delaying and/or slowing gastric emptying benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
exendin agonist peptides which can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Type: P Check: 2828

regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and typerglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which howld be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
  diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia;
hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

                                                                          Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY24852;
       AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as exending to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which hower plasma glucose levels and in treatment of disorders which hower benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which lower benefited with agents useful in delaying and/or slowing gastric emptying

The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-pandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                           Exendin, agonist, Heloderma sp; Gila monster, venom; lizard, diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY24849 Length: 29 February 4, 2005 13:32 Type: P Check: 2759 ound using !seq5' (mohamed337.key)

aay24850 ; Exendin agonist peptide #42.

(AMYL-) AMYLIN PHARM INC.

Prickett KS;

Beeley NRA,

WPI; 1999-394773/33

```
AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                               New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin, agonist, Heloderma sp, Gila monster, venom, lizard, diabetes mellitus type I, diabetes mellitus type II; hyperglycaemia, hypoglycaemia, plasma glucose, gastric emptying, stomach emptying.
hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Type: P Check: 9586
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   to: 31

AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agoniets which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in reatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

```
regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which hower plasma glucose levels and in treatment of disorders which lower plasma glucose levels and in treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                      Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

ANY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and alow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                     New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia;

                                                                                                                                                                                                                                                                                                                                        AAY24842;
AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                      New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New exendin agonist peptides – can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of gastric models in treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying

They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New exendin agonist peptides - can regulate gastric motility'and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and typerglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

```
AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as agents to regulate gastric motility and to slow gastric emptying, as mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in reatment of disorders which lower blasma glucose levels and in retarment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY24839 Length: 35' February 4, 2005 13:32 Type: P Check: 7014

AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as agents to regulate gastric motility and to slow gastric emptying, as mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                   Exendin, agoniet, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and alow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as agents to regulate gastric motility and to slow gastric emptying, as mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in reatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                             New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY24835;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                     New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin, agonist, Heloderma sp, Gila monster, venom; lizard, diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia, hypoglycaemia, plasma glucose, gastric emptying, stomach emptying.

AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can bused for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidence by the ability to reduce poet-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes hyperglycaemic or hypoglycaemic conditions. They can also be used for treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptyir
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             new exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as agents to regulate gastric motility and to slow gastric emptying, as mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

```
AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which hower benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                        New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                    Claim 18; Fig 4; 108pp; English

New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

AAV24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic Claim 18; Fig 4; 108pp; English.

```
and
conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.

emptying AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and alow gastric emptying. The peptides can k used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of type I and II diabetes hyperglycaemic or hypoglycaemic conditions. They can also be used for treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited by agents which lower blasma glucose levels and in treatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptyii Sequence 28 AA;

AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which hower benefited with agents useful in delaying and/or slowing gastric emptying
                                                                                                                                                                                                                                                                                                                                                                 New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY24828;
  agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in treatment of disorders which would be benefited by agents which would be benefited with agents useful in delaying and/or slowing gastric emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              þe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New exendin agonist peptides - can regulate gastric motility and slow gastric emptying, used for treating, e.g. diabetes.
                                                                                                                                                       Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin, agonist, Heloderma sp; Gila monster, venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AMY24809 to AAY24877 represent exendin agonist peptides which can regulate gastric motility and slow gastric emptying. The peptides can be used for treating e.g. diabetes or hyperglycaemic or hypoglycaemic conditions. The peptides are exendin agonists which have activity as agents to regulate gastric motility and to slow gastric emptying, as evidenced by the ability to reduce post-prandial glucose levels in mammals. They can be used for the treatment of Type. I and II diabetes and hyperglycaemic or hypoglycaemic conditions. They can also be used for the treatment of disorders which would be benefited by agents which lower plasma glucose levels and in reatment of disorders which would be benefited with agents useful in delaying and/or slowing gastric emptying
